

NutriParse Reader – User Guide

Live Application

 <https://nutriparse-readervercel-caqtzil1h-amilton-koxis-projects.vercel.app>

NutriParse Reader is a web application designed to automatically extract allergen information and nutritional values from food product PDF documents. It supports both digitally generated PDFs and scanned/image-based PDFs, applying text parsing with an OCR fallback when necessary.

This guide provides end users with clear, step-by-step instructions on how to:

- Upload and manage PDF files
- Run extractions
- Review and interpret structured results
- Reset the workspace when needed

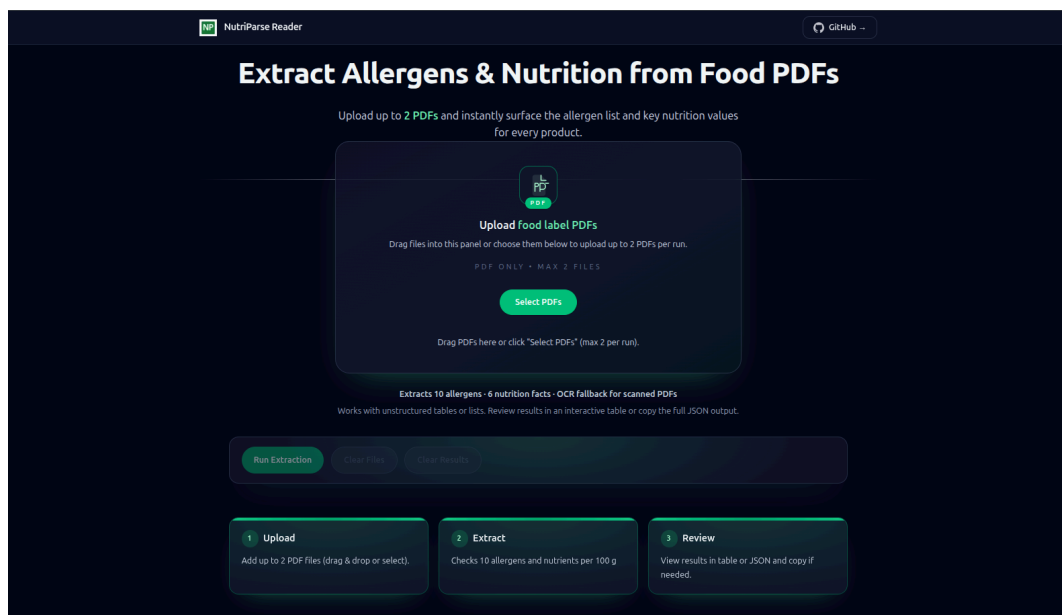

Image 1- Home page

Step 1 – Upload PDF Files

On the home page, select up to two PDF files at a time. Files can be added either by:

- Clicking 'Select PDFs' and choosing documents from your computer, or
- Dragging and dropping files into the upload area.

Uploaded files appear in the queue below the upload button.

Step 2 – Confirm Files in Queue

After adding a file, the queue will show its file name.

- If only one file is selected, the system will prompt that you can add one more.
- Once two files are uploaded, the message changes to indicate readiness for extraction.

Step 3 – Run Extraction

Click 'Run Extraction' to start the process. The backend service will analyze the documents using AI-assisted parsing.

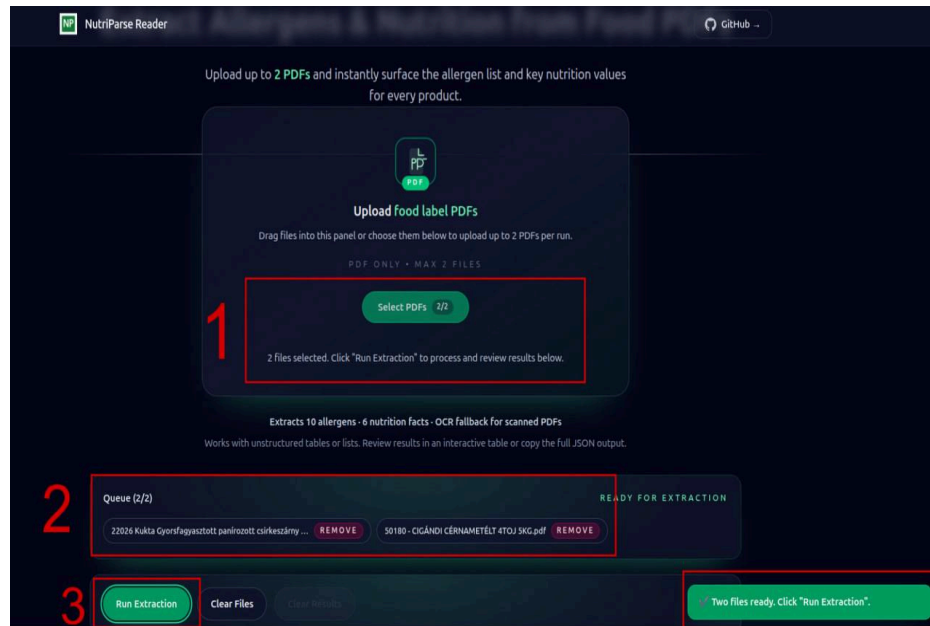

Image 3- Upload for two PDF Files

Step 4 – Review Extraction Results

When processing completes, results are displayed in structured format:

Allergens:

- Green – ABSENT: not detected
- Orange – TRACES: may be present in traces
- Red – CONTAINS: explicitly present in the product

Nutrition (per 100g):

- Green → Energy (kJ/kcal)
- Red → Fat
- Orange → Carbohydrate
- Pink → Sugar
- Purple → Protein
- Blue → Sodium/Salt

Each result card also shows the mode ('Text' for digital PDFs, 'OCR' for scanned files) and the confidence score (percentage reliability of the extraction).

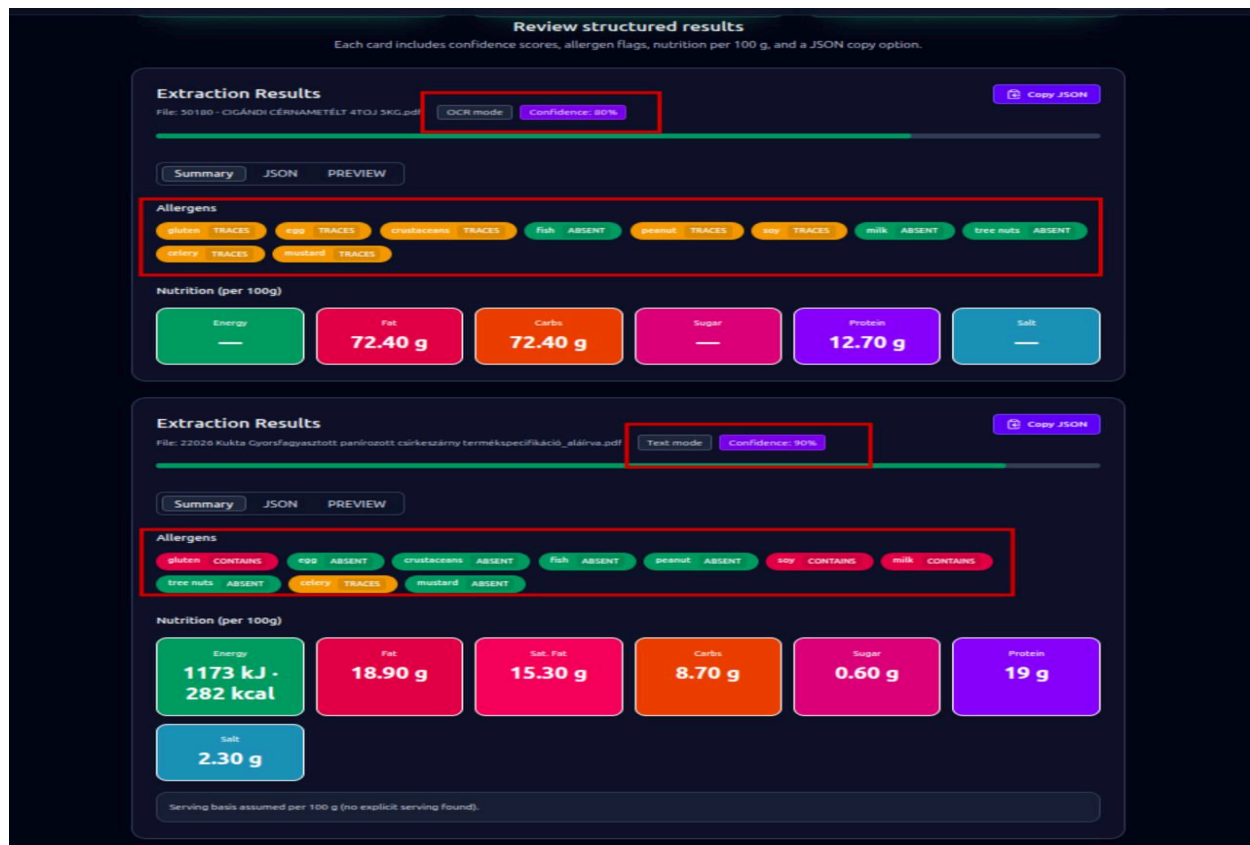

Image 6- Extraction Results for two PDF Files (Text' for digital PDFs and OCR' for scanned files)

Step 5 – Switch Views

Results can be displayed in three modes:

- Summary → default view with allergen and nutrition cards
- JSON → raw structured data, suitable for developers
- Preview → plain text extracted from the PDF

Step 6 – Clear Results and Files

The interface provides two options for resetting:

- Clear Files → removes files from the queue (before extraction)
- Clear Results → deletes the extracted results (after processing)

This allows you to start a new extraction with different documents.

Notes & Limitations

- The free backend hosting (Render Free tier) may introduce short delays or occasional failed requests due to cold starts.
- Large PDFs (more than 6 pages or image-heavy files) may require longer processing times and can sometimes trigger timeouts.
- OCR mode is inherently less accurate than text mode, especially when working with low-resolution or poorly scanned documents.
- The system currently supports a maximum of **two PDF files per extraction run** to ensure stable performance.
- For best results in **live mode**, it is recommended to process **one file at a time**, reducing the risk of delays or timeouts.
